How to adjust a resmed s9 cpap machine

Posted by Advans CPAP Staff on 8/5/2021 to Articles The ResMed Airsense 10 is a CPAP we repair. The Aircurve 10 is ResMed's BiPAP line of devices we service as well. Listed below are problems and issues we have experienced with machines that have come into our service center. Increase loudness Whirring or whistling sounds as you inhale and exhale Burning odor Start / Stop / Power button no longer responds Start / Stop / Power button does not click Humidifier no longer heating heating up Humidifier not using the water as much as before Water leaking Black specs in water chamber LCD screen flickers LCD does not light up No power Auto on/off no longer works No air coming out Air pressure is too high or too low Air pressure is erratic Air pressure does not adjust Air leaks Blast of air when turning on Unit shuts off during use Error codes Motor life exceeded message Data is not recording There are four main components in the ResMed Airsense 10. The parts are the main PCB / control boards, blower motor, wireless module and humidifier heater plate. The most common parts we replace are the control boards / PCBs and blower motors. We will list why those components contribute to the majority of ResMed Airsense cpap repairs. From the list above the following components will need to be replaced if they demonstrate specific symptoms. Control boards are damaged mainly from user error, moisture, impact, contamination or use of ozone cleaners. Keep in mind, for many of the issues listed, we have other methods we try first to repair the machine before having to replace a control board. Some examples are power and humidification problems. Power issues can be related to a faulty AC adapter. Humidifier heating problems normally are due a to malfunctioning heater plates. Main PCBs have to be replaced as a last resort for the reasons below if other methods cannot resolve them. Start / Stop / Power button no longer responds Start / Stop / Power button does not click LCD screen is not lighting up LCD screen flickers LCD does not light up No power Auto on/of no longer works No air coming out Air pressure is too high or too low Air pressure is erratic Air pressure does not adjust Users may sometimes interpret their CPAP machine problems as a blower / motor issue, when they could really be caused by worn seals in the humidifier chamber lid or the round outlet seals which sit in between the machine and water chamber. On occasion those items can be the main cause, however they are normally secondary issues to the motor itself. Blowers / motors are the most common ResMed Airsense 10 auto CPAP repair we perform and their symptoms are below. Increase loudness Whirring or whistling sounds as you inhale and exhale Burning odor Motor life exceeded message Black specs in water chamber - ozone damage No air coming out - locked motor Contamination - from moisture or dirt "My humidifier isn't working. When I wake up in the morning no water is used up." This is a very common complaint, but don't worry as your humidifier is most likely working just fine. Gauging by how much water is used during the night in the morning is an incorrect method to test functionality. The heater plate either heats up or it does not. A quick way to test if it works is to activate the "heater warm up" feature in the "my options" menu. Touch the heater plate after 30 seconds after activating the "warm up" feature. It will be warm to the touch if all is well. Increase the setting of the humidifier if you are drying out. Adding an external room humidifier will also help if the setting is maxed out. If you have a problem with your ResMed Airsense 10, post a comment below and share what you are experiencing. We can help. If you need a faster response contact us directly with a CPAP repair inquiry HERE. Remember the last time you went to the pharmacy to pick up a prescription? You walked up to the counter, handed over the script, waited a few minutes and received a full bottle or package of something - pills, liquids, whatever. "Take the prescribed dose once per day for ten days, with food", the pharmacist said. Fast forward to right now. You've just bought a CPAP machine - or maybe you've been using a CPAP machine for years - and you've discovered that you don't know how to adjust the pressure setting. The primary function of the CPAP machine is to blow air at a certain pressure, and you don't even know how to change the pressure? That's like not knowing how to change the ringer volume on your cell phone, isn't it? Isn't that a vital function that all CPAP users should be familiar with? To you - and to most other CPAP users - the CPAP machine is a mysterious "black box". Something only someone else knows how to program. You just turn the thing on, put on your CPAP mask and hope your CPAP therapy works as advertised. So why is that you don't know how to adjust the pressure setting on your CPAP machine? It's a 30-second procedure that takes only a few pushes of a couple of buttons. The problem is that the manufacturer of your CPAP machine has hidden some controls from you. In fact they've hidden an entire menu of controls found in what is commonly referred to as the "clinician's setup" or "provider setup" mode. Before I begin spilling the beans about the clinician's setup, consider that trip to the pharmacy one more time. When you think about it, there's an awful lot of trust between you and your doctor, the doctor and the pharmacist, and the pharmacist and you. You've been told what to do, and they're assuming you're going to do it - correctly. You're also assuming your doctor wrote the right prescription and the pharmacist filled it as written. Taking this trust issue a step further, consider the fact that when you get a prescription filled at the pharmacy, you don't have to go get one pill at a time. You're trusted with the whole bottle of pills and everyone involved is assuming that you're responsible enough not to do anything stupid with those pills. So given the secret of the clinician's setup mode would you suddenly become irresponsible? Untrustworthy and reckless? Bent on self destruction by way of CPAP machine? It could happen. But I don't think it will. I firmly believe you are your own best primary care provider - that nobody else is looking out for your health and well being as much as you are. I therefore think you should be trusted with the knowledge of how to adjust the pressure setting on your CPAP machine. Don't get me wrong, I'm not advocating changing the pressure setting on your CPAP machine willy nilly, without regard for your own well being, and I'm certainly not providing you with medical advice (primarily because I don't know you and I'm not a doctor). I think all responsible CPAP users should use common sense when using their CPAP machines, and I think it's a very good idea to talk with your physician or sleep therapist before making any changes to your CPAP therapy. Sleep apnea is a very serious condition, and altering your prescribed therapy settings could reduce the effectiveness of your CPAP therapy. Whether you have a constant pressure "regular" CPAP machine, an automatic CPAP machine or a bilevel CPAP machine, getting into the clinician's setup mode is fairly simple. I'll outline the process for two model lines of CPAP machines. Resprionics REMstar M Series To get into the clinician's setup mode in a REMstar M Series CPAP machine or a BiPAP M Series CPAP machine follow these steps: unplug the power cord from the back of the CPAP machine lift the LCD cover and press the two buttons closest to the back of the CPAP machine while pressing the two buttons, plug the power cord into the CPAP machine You'll hear two beeps and then you'll see the word setup in the lower right corner of the LCD screen. When you select setup you'll be in the clinician's mode where you can adjust every feature of the CPAP machine, including the pressure setting. Below is the list of settings you can cycle through on a REMstar Plus M Series: CPAP Pressure (only in provider setup mode) Altitude Fine Pressure Adjustment (only in provider setup mode) C-Flex Setting Ramp Time Ramp Start Pressure Mask Alert Auto Off Patient Reminder (only in provider setup mode) Puritan Bennett GoodKnight 420 Series To get into the clinician's setup mode in a 420 series CPAP machine follow these steps: make sure the CPAP machine is plugged in find the secret button beneath the two "o"s in the word GoodKnight which appears just above the LCD screen press the secret button and the Information Access button simultaneously for 2 or 3 seconds. The CPAP machine will now be in the provider setup mode. Press the Information Access button to cycle through the list of adjustable settings, and use the arrow buttons to make adjustments. Below is a list of settings you can cycle through on a Puritan Bennett 420G: CPAP Pressure (only in provider setup mode) Ramp Time Ramp Start Pressure Hour Meter Value (which cannot be adjusted) Compliance Meter Value (which can only be reset to 0) Offset of Pressure Sensor (used for calibration purposes) (only in provider setup mode) Machine ID Number (which cannot be adjusted) PDF Setup Instructions Note: As of 3/25/2008 Resprionics has indicated their displeasure with us posting their "private and copyrighted for clinician-use only information". As a result we've removed the Resprionics manuals from this article. Feel free to call us with questions. GoodKnight 420G Andrew Senses President www.cpap-supply.com CPAP-Supply.com is a leading online retailer of CPAP equipment. Located in Spokane, WA CPAP-Supply.com has been serving thousands of customers around the world since 2001. Founded on a belief that patients are their own best primary care providers, CPAP-Supply.com understands the importance of educating patients and customers on both the effects of and treatment for obstructive sleep apnea.
